

ABSTRACT

It is an object of the present invention to provide an automated evaluation system that can retain the quality of an application program and also maintain the stability in the automated evaluation.

An automated evaluation system 1 that automatically evaluates an application program to be operated on a target system according to a given input event and a reference output result corresponding to the given input event, the automated evaluation system 1 is characterized in being accessible to a simulation apparatus 2 that simulates an operation of the application program, and comparing a simulation result corresponding to the given input event by the simulation apparatus with the reference output result to thereby perform an automated evaluation.
